Xbox one controller driver for mac os sierra Even the player 1 light shows up in El Capitan & Sierra now, and unplugging/plugging back in no longer causes a kernel panic, and I can cold boot with the pad already connected, which didn't work before, even on real hardware.. I was getting Kernel panics on El Capitan and Sierra (both real Mac hardware and my Hackintoshes) with the older 'improved' 360 driver mentioned earlier in the thread whenever I unplugged the device from any USB port, so upgraded to this version: and fine so far on a z77 Hackintosh and a 2015 Macbook Air and 2015 Macbook Pro.

Just a necro update to this thread Edit: Only replied because this thread showed up first for me in a Google search, even though it is 2 years old, so hopefully this will help someone else who had the same issues.
